Since its inception in 2002 PowerShell has been deeply influenced and improved by the passion and contributions of over 80 contributors. Since that time we, together, have built a community that supports each other, provides Summits and Conferences and gives great feedback to the product.

Satya's new leadership and customer-focused mindset has encouraged and empowered us to do more. We've started a number of successful community initiatives, such as the PowerShell Home Page, the PowerShell Foundation, and the PowerShell Project.

## Announcing PowerShell Core 6.1

We're proud to announce that the latest version of PowerShell has been released! This marks our second release of PowerShell Core, the open-source edition of PowerShell that works on Linux, macOS, and Windows.

By far, the biggest feature of this release is compatibility of built-in Windows modules with PowerShell. You can now natively run those modules/cmdlets with PowerShell Core and easily transition from Windows to Linux or macOS.

Thanks to everyone that made this release possible, including our contributors, users, and anyone who submitted feedback.

PowerShell Core 6.0 is a new edition of PowerShell that is cross-platform (Windows, macOS, and Linux) and built for heterogeneous environments and the hybrid cloud.

First and foremost, thank you to all of our amazing community, especially our open-source contributors, which you can find on our community dashboard at <https://aka.ms/PSGitHubBI> for donating your time to PowerShell Core. Whether you contributed code, tests, documentation, issues, or even just your feedback, we are extremely grateful for the sweat and tears that you've invested in PowerShell. (For those interested and looking to get involved, check out our [Contribution Guide](#) on GitHub. You don't have to be a guru to help out!)
